

**Abstract**

An indexer for positioning a limb extension bar used with an examination table. The indexer permits a selective fixed position in the forward and backward  
5 directions and a selective fixed position with respect to rotational movement. The indexer consists of a housing and a translator that sits within the housing. A locking member sits within the translator. The locking member has meshing teeth that mate with a similar structure  
10 located on the housing to selectively fix the extension bar in a desired position.
